Week 3 - Rethinking URL and Textbook 6-12

I found it interesting that HTML5 is starting to define behavior. This seems to violate the strict separation previously between behavior, content, and style. There must be a new best practice or standards surrounding this change. Interesting to hear about the interaction between HTML and bots, how using specific tags and practices will help benign bots to index and navigate your site. The bit about bandwidth regarding images was neat, it seems using vector based approaches saves immensely on bandwidth (which makes sense), though I assume it is not always possible to successfully convert raster images to vector. The assignment taught me a lot regarding using external CSS, using JS including the getElementById / getElementsByTag functions and for loops to navigate the elements returned, also DOM in describing the elements on the page.
